Although there is no precise unified definition of PML, PML refers to the percentage of expected damages caused by a maximum-level earthquake that happened during an assumed period for the economic life of a building, to procurement cost for restoring the expected damages. The expected period for economic life of a building is 50 years, which is the useful life of a standard building. The expected maximum-level earthquake here means an earthquake that happens once every 50 years with 10% probability. This means that this level of an earthquake statistically happens once every 475 years.
